Swirl-atomizer

◀ Field spraying installation

In pest control, let it be a cockchafer year or a warm, humid early summer, bringing fungus blight, high efficiency is of particular importance in field spraying installations. Your Unimog can provide this efficiency. Your Unimog in itself can offer all the advantages of a tractor, plus a trailer carrying water and other required material, plus a spraying unit.

Consider a self-contained unit — the Unimog. It is more manoeuvrable than a tractor and trailer and so, being steered correctly between rows, does less damage to crops. Four wheel drive minimises damage which otherwise results from wheel slip, particularly when turning.

All equipment, including a large water tank, is carried on the auxiliary loading platform. This means that spraying can be continued for longer durations without interruption.

Proceeding to the field of operation, changing from one job to another or whilst refilling its water supply, the Unimog maintains its full speed. This naturally saves time and improves efficiency. The equipment obtainable can provide misting, sprinkling, spraying, dusting or a combination of any of these or, again a field or tree-spraying installation.

The apparatus is driven by the rear power take-off shaft, the auxiliary secondary drive to the rear power take-off shaft or by the belt pulley. Here again, the all-weather cab protects the driver against any possible ill-effects of poisonous chemicals.
